(a) locking phase diagram
escapes a.s. ($T \geq \gamma$)
survival 1/2, $N = 10$
survival 1/2, $N = 1000$
GPT-2 (124M)
Pythia-160M
locked ($T < \gamma$)
temperature T
growth rate γ in $\Delta_c = a + \gamma \ln c$
(b) barrier growth law (AICc)
GPT-2 (124M)
Pythia-160M
loops where law fits best
$a + \gamma \ln c$
$a + bc$
saturating
(c) locking temperature vs horizon
GPT-2 (124M)
Pythia-160M
T at which survival = 1/2
horizon N (cycles after burn-in)
